Conclusion

In the activity I could realize how the Bluetooth module works in the company of Arduino. First, I could notice how the connection of the cables is done, but that is the easy part, then we used the code, but at the time of uploading or sending the code to the Arduino board I was given a problem, so I had to investigate how to solve this problem. I saw some videos on YouTube and read on the official website the way to solve this detail and finally I could find that I had to disconnect the cables from pins 0 and 1 to be able to send the code for the end to be able to make the connection with the module and my Bluetooth device. In the end it was a great practice that we value for being the first time we used a Bluetooth module.
